

## Video Endoscope & Ear Flush System

Our video endoscope allows detailed imaging of the horizontal ear canal and ear drum through magnification and projection to a television screen. Images can be recorded and printed to help educate and inform clients. This system also has a small rigid endoscope that can be used to image the upper airways including the larynx, pharynx, and nasal passages. The video endoscope is equipped with an ear flush and suction system that is used to flush the ear canals of animals with severe ear infections that may also involve the middle and inner ear. Ear flushing is only performed under general anesthesia.
